Technical specifications for street and storm sewer construction for this project shall be the Construction details (Technical Specifications) of the Mississippi Standard Specifications for State Aid Road and Bridge Construction, 1989 Edition.

Equipment, Materials and Construction of Water Distribution System and Sanitary Sewer System shall conform to "UTILITY AND STREET CONSTRUCTION FOR THE WATERFORD ACCESS ROAD" A Separate Bound set of specifications by GUEST CONSULTANTS, INC.

If during construction the Engineer finds it necessary to change the lines, dimensions, thickness, grades, slopes, sections or quantities or if such changes are ordered for any other reason; the final quantities will be recomputed based on the plan changes, as a result of authorized changes.

GENERAL NOTES

1. All excess excavation shall be placed evenly on adjoining property as directed by the Engineer.
   All trenched shall be properly prepared and tested to a minimum of 95% of MDD and compacted to ASTM Standard Proctor Density.
2. Prior to placement of asphalt base, density tests shall be performed by a registered and laboratory and the contractor's engineer.
3. The contractor is responsible and bears full the location and/or protection of existing utilities. On the plans it is believed to be the best information available at the time of preparation of these plans. The contractor must call the utility companies and the City of Kingsland at least 72 hours before beginning excavation to determine exact field locations of utilities. It shall be the responsibility of the contractor in locating all utilities which conflict with the proposed improvements shown on the plans.
4. Elevations are based on NGVD, datum.
5. Manhole Tops and Valve Covers to be adjusted on job site as necessary to match finished grade.
6. Undesirable or unstable material and backfilling with select borrow may be required as directed by the engineer.
7. Stop sign, and Street Signs are a Separate Pay Item.
   Cost to be Absorbed in Other Items.
8. Contractor shall comply with the requirements of the City of Kingsland Erosion Control Ordinance and the EPA Storm Water Pollution Prgm.
9. Written dimensions and elevations shall govern over scaled dimensions and elevations.
10. The lengths of sanitary sewer lines shown on these drawings are the distances from center to center of manholes.
11. Fill under floor and parking slabs shall be compact in maximum lifts not to exceed 8" in thickness. Each lift shall be compacted to 95% of maximum density as determined by ASTM D-698 method of test. Fill under floor slabs shall be free of all vegetation, rock or gravel larger than 3" in diameter and other debris and shall have a plasticity index of 3 when tested by method of Texas Highways.
12. Backfill for sanitary sewer lines beginning 1 foot above crown shall be compacted in 6-inch lifts. The top five feet shall be compacted to 95% of standard proctor density.
13. Water and sanitary sewer service connections to extend the full required length of lines. Ends not yet to service by installed fittings capped. Locations of ends shall be accurately established and recorded by the contractor and shall be approved by the engineer and City Secretary prior to backfilling. A set of the approved and revised recorded as a service basis for information to the engineer.
14. The contractor shall not "divert water" in sewer appurtenance with the following exception: Where a bypass is required, it shall be with the approval and when a bypass and at appropriate intervals the bypass removed.
15. Provide 10 foot horizontal clearance between all water and sewer lines. At locations where the water and sewer lines cross, each pipe, where shall be a minimum clearance of 18 inches with the water line supported over the sewer line. If these requirements cannot be met, the sewer line shall be encased in the type specifications as the water line for a distance of 9 feet each side of point on the minimum separation is obtained.
16. The utility contractor shall be responsible for testing the water and sewer systems in accordance with the specifications and shall notify the engineer at least 24 hours in advance of conducting any tests. Tests on water and sewer will be as required by the City of Kingsland.
17. Water service assemblies shall include all tubing from the main to the meter box, tapping saddle, corporation stop, meter, yoke, and meter box and "No. 7 DBL Check Valve" detailed to be supplied by the City of Kingsland.
18. Contractor is required to keep ground surface within right-of-way to grades shown on the typical section prior to grassing and acceptance of project.
19. All block walls of curb inlets and junction boxes shall be plastered inside and outside with a 1:2 mix of cement mortar 1/2" thick.
20. Class "B" structural concrete or precast may be used to construct inlets in lieu of masonry.
21. Concrete slab and covers for inlets and junction boxes shall be class "B" structural concrete.
22. Curb and gutter shall be 3000 PSI minimum concrete.
23. Provide expansion joints with 3/4" expansion joint material at intervals of not greater than 30 feet for curb and gutter.
24. Provide contraction joints in curb and gutter at intervals of not greater than 10 feet.
25. Contractor shall comply to the fullest extent with the latest provisions of OSHA Regulations or any other applicable safety jurisdiction for excavation and trenching procedures. The contractor shall use proper ladders, planks, barricades, and other means of protection, that is to facilitate, but not limited to, cribbing and upright trees all excavation and trenching. Contractor is responsible to comply with particularized criteria for OSHA.
26. The contractor shall adhere to all terms & conditions as outlined in the General NOI N.E.S. permit for storm water discharge associated with construction activity.
27. After frame and/or curb and gutter string lines have been set and before concrete is poured, contractor shall verify that all gutters drain to inlets.
28. Shallow subgrade under storm sections (from 1/2 cut transitional cuts) at top of subgrade grade shall be undercut and backfilled as required to prevent pavement from settlement due to a variation of 3 in the subgrade. Undercut shall be to a depth of not less than 12 inches below subgrade. Undercut shall extend to within the limits of the roadway pavement. Backfill material shall be approved by the engineer & compacted to not less than 95% of density determined by ASTM D-698. Undercut shall be paid at the unit price bid per cubic yard for "Undercut Excavation". Backfill material will be paid for at the unit price bid per cubic yard for "Select Fill". Backfill must be material shown, approved or used on the project. Backfill must be material shown, approved or used on the project. Backfill must be material shown, approved or used on the project.

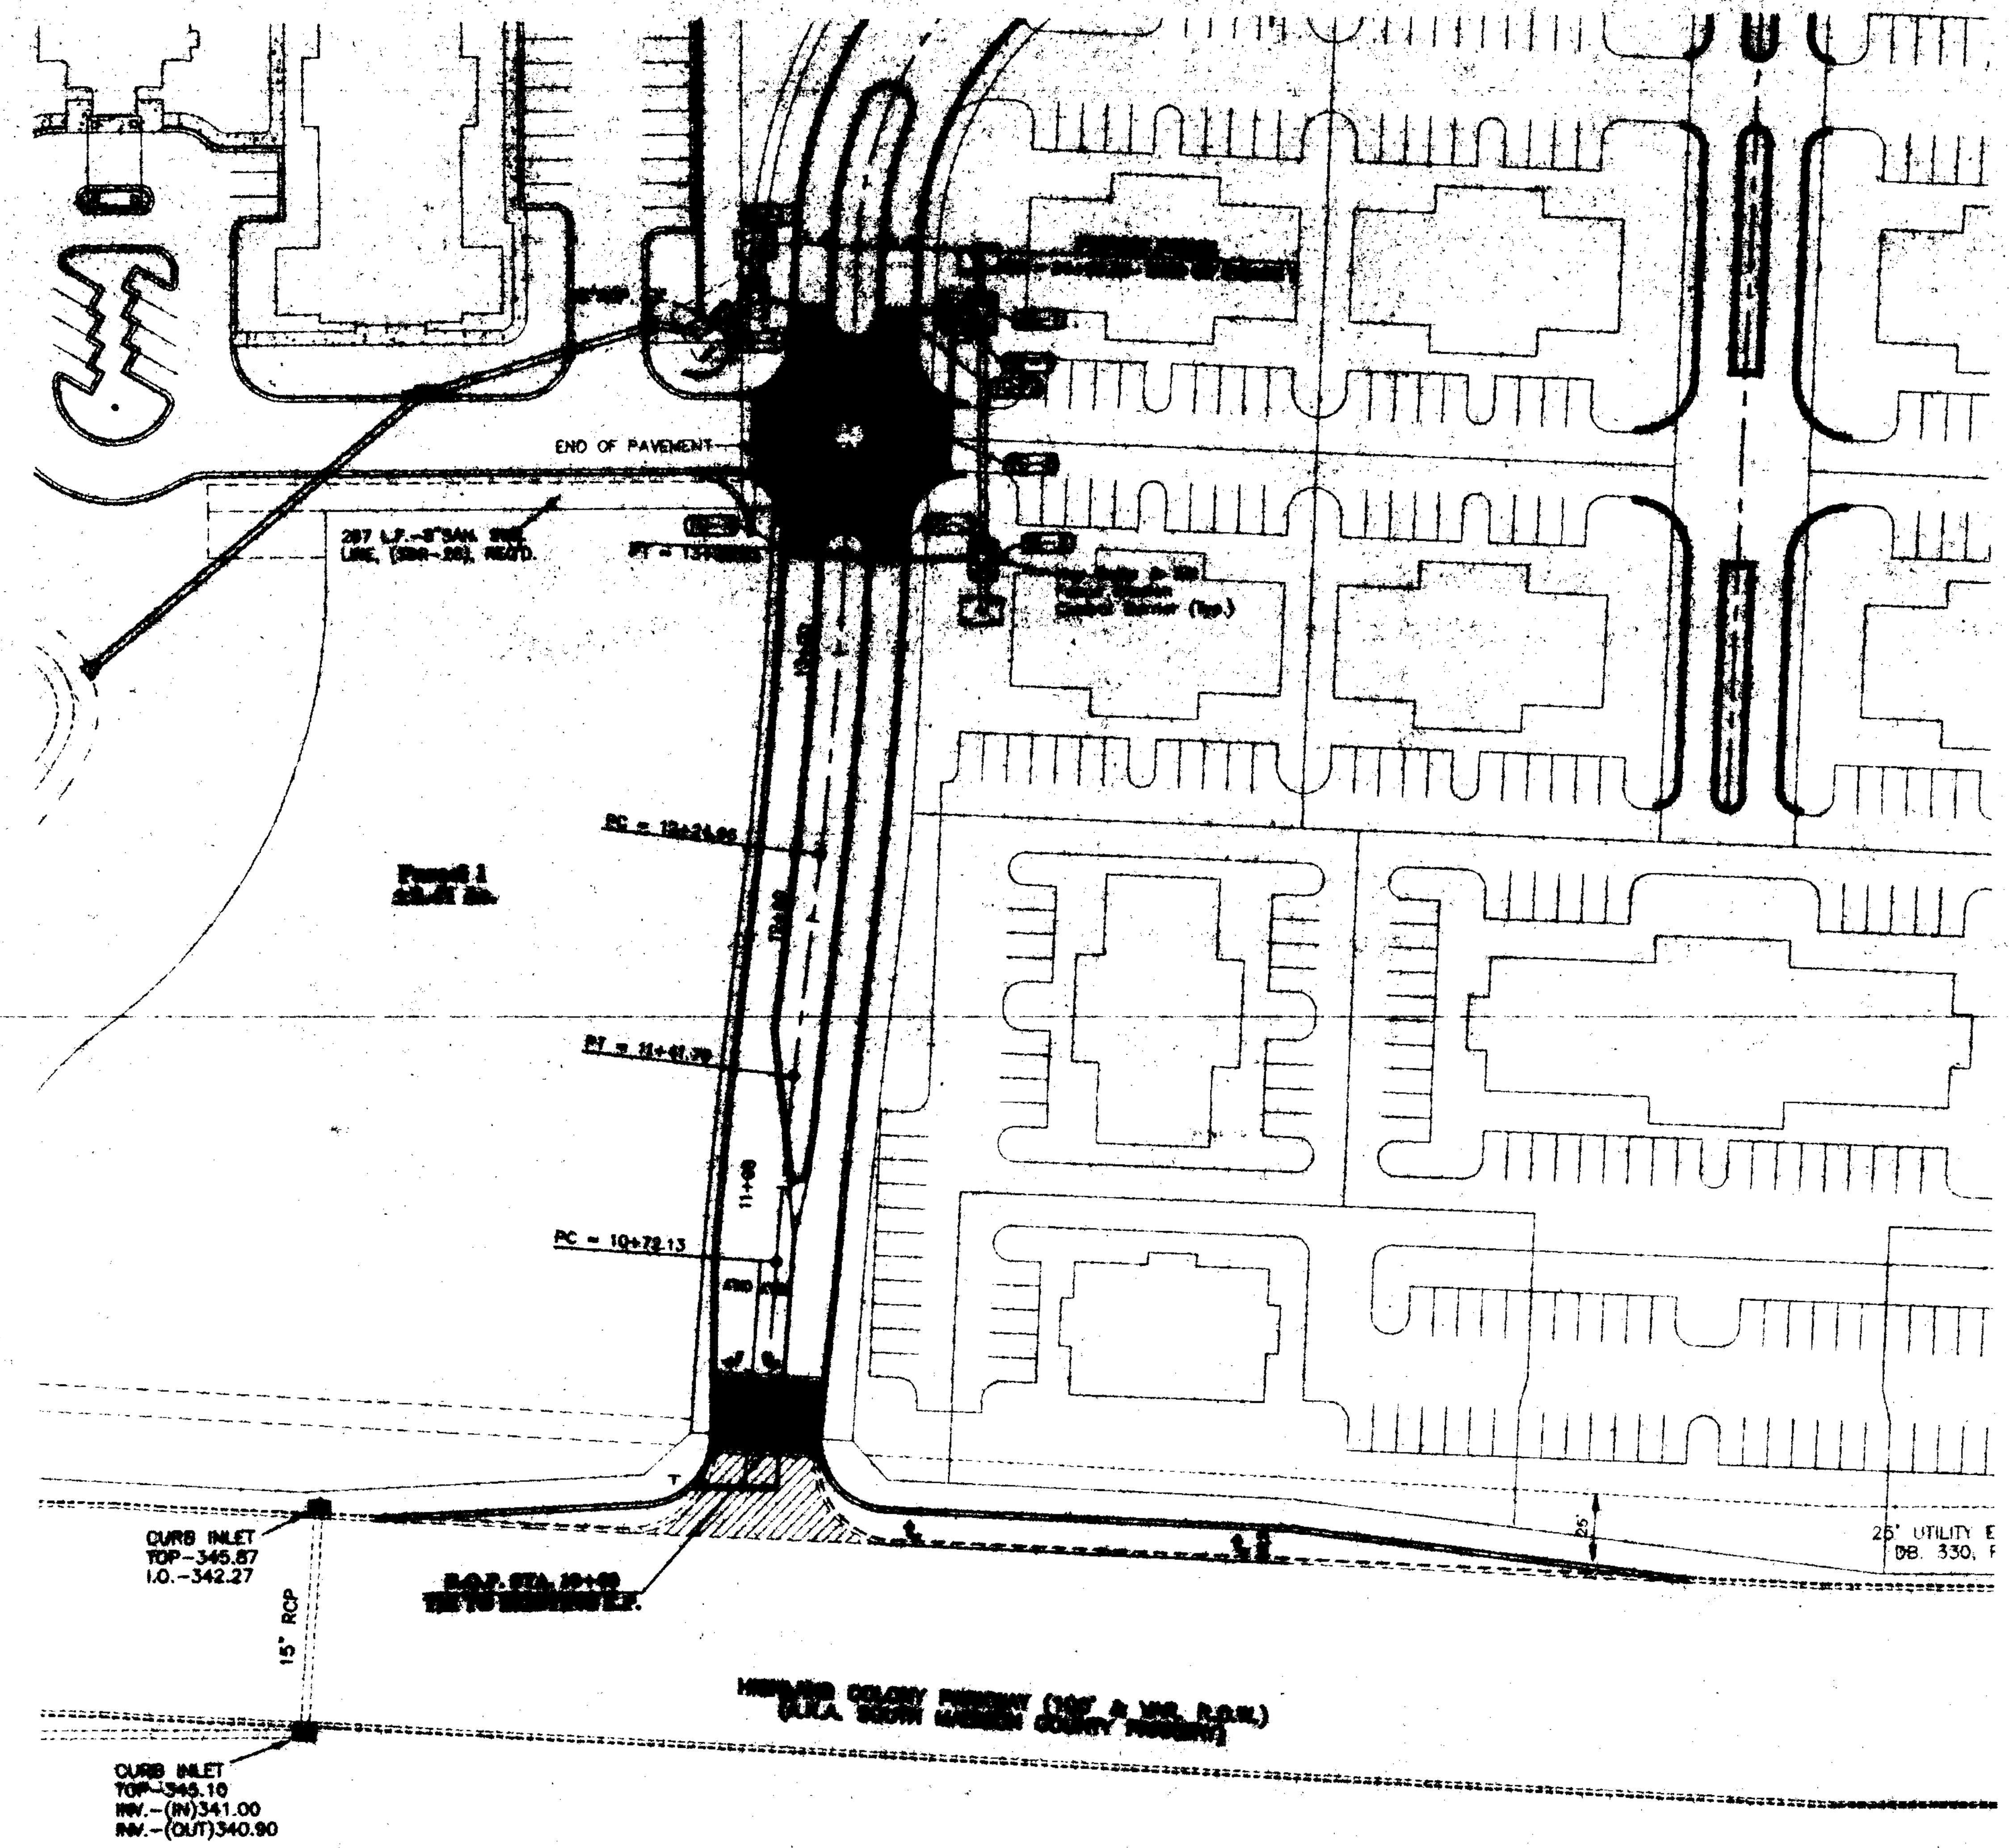
DESIGNED: RICHARD SOWERS DATE: 06-26-00 FILE: 2738-[illegible]	APPROVED BY: PAT GUEST JOB NO. G-2738	REVISIONS	Guest Consultants, Inc. CONSULTING ENGINEERS • LAND SURVEYORS THIRTY SIX EASTGATE DRIVE • P.O. BOX 1225 • BRANDON, MS 39043 TELEPHONE (601) 825-8541 FAX (601) 825-3032	PROJECT THE COMMONS, PHASE 1	STORM DRAIN LAYOUT	SHT. NO. 6



[illegible]

Contractor shall adhere to all terms and conditions as outlined in the [illegible] Permit for storm water discharge associated with construction activity.

[illegible]

The following construction sequence for this project is planned to [illegible] the amount of sediment movement on site and sediment [illegible] from the project site.

A. [illegible]

The grading work will include removal of [illegible] material and [illegible] as required by the geotechnical report.

B. [illegible]

Silt fence shall be placed on the down slope edge of all [illegible] [illegible]

Install silt fence in accordance with manufacturers recommendations.

[illegible]

[illegible] road culvert entrances [illegible] landscaping are complete.

Refer to sheet _ of _ for silt fence details.

C. [illegible]

Install the storm-drain system to the grades and elevations of the [illegible] shown on the plans. Care shall be taken to minimize [illegible] into the storm drain inlets until the road/parking [illegible] applied. [illegible] method of inlet protection.

Refer to sheet _ of _ for temporary [illegible] details.

D. [illegible]

Vegetate and/or landscape all [illegible] as soon as possible during the construction operations.

[illegible]

Both the short-term (during construction) and long-term (after construction) maintenance needs must be addressed.

A. [illegible]

All erosion and sediment-control practices will be checked for stability and operation following every [illegible] rainfall but in no case less than every week. Any needed repairs will be made immediately to maintain the practice performance as designed.

Sediment will be removed from the upstream face of the silt fence when it increases to about six-inch depth at the fence. The silt fence will be replaced as necessary to maintain a barrier.

All vegetated areas will be fertilized and [illegible] as needed to maintain a vigorous and dense vegetative cover.

All drainage structures that will be exposed to stormwater run-off during construction shall receive temporary erosion checks (Hay Bales). Refer to sheet _ for details.

B. Long Term

All vegetative areas will be maintained in adequate condition to provide proper ground cover and reduce any areas of potential erosion. Where vegetation is lost, the area will be fertilized and seeded or other acceptable methods used to restore proper cover.

NOTE:

Synthetic filter fabric shall be a pervious sheet of propylene nylon, polyester and shall be certified by the manufacturer or supplier and conform to the following requirements:
a) Filtering efficiency (75% minimum)
b) Tensile strength that 70% maximum elongation=50 lbs/lin. in. (minimum)
c) Flow rate=0.3 gal./sq. ft./min. (minimum)

ISSUE DATE: OCTOBER 1, 1998

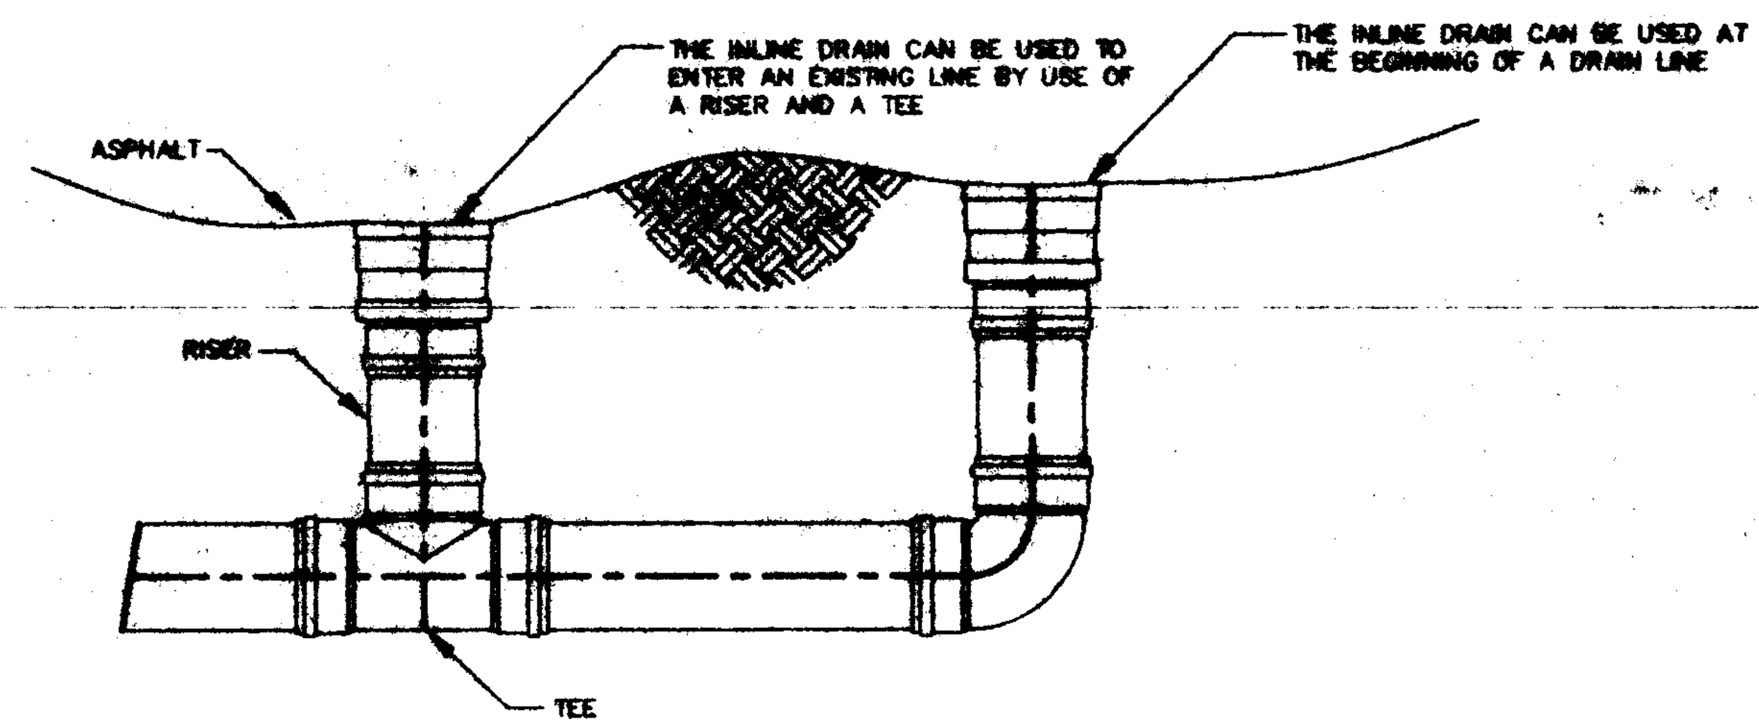
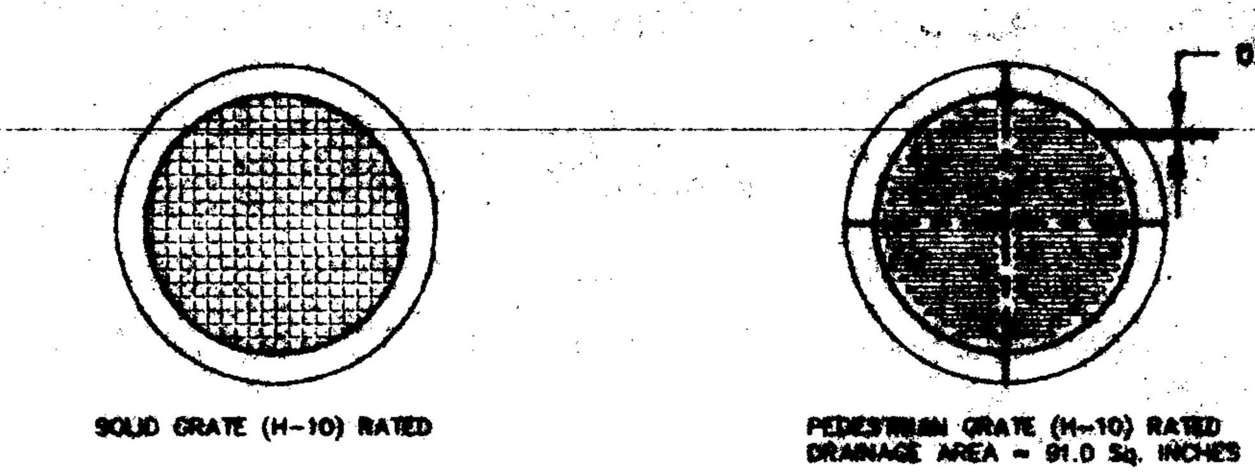
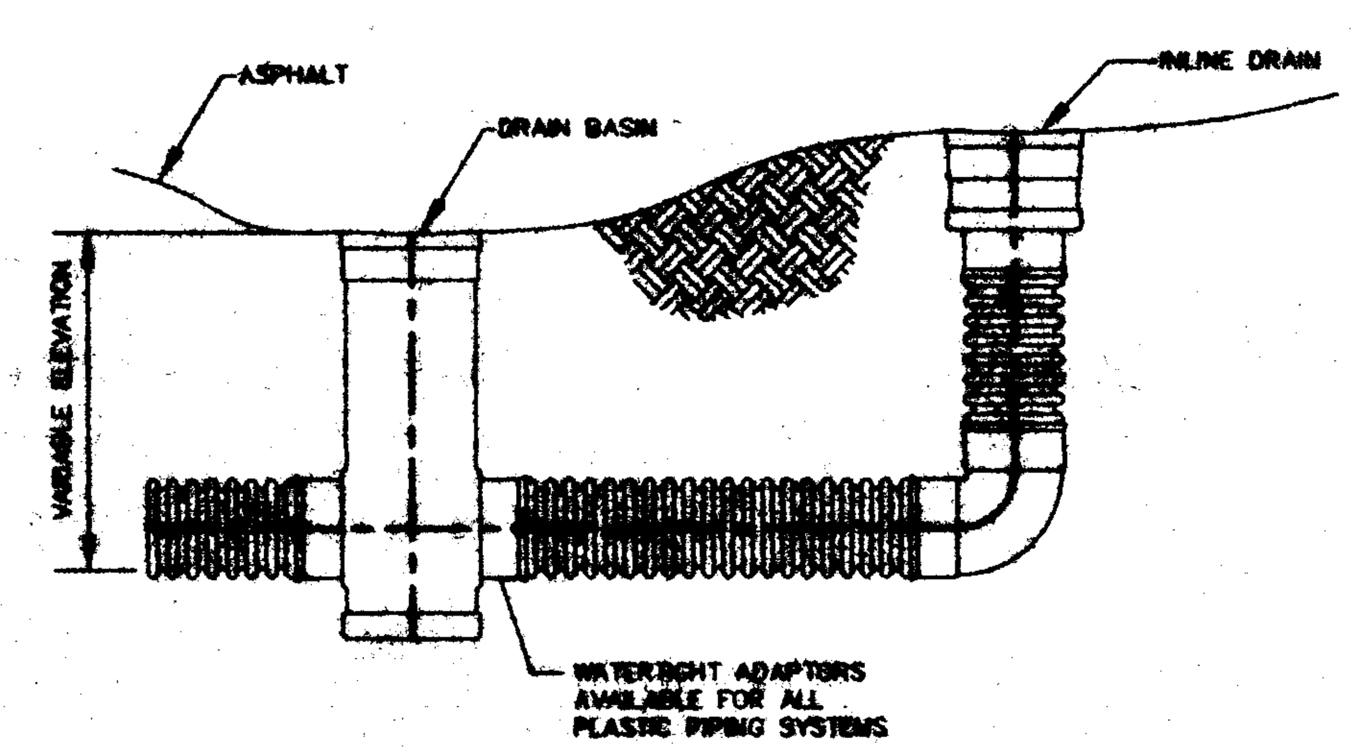
DRAIN BASIN



DRAIN BASIN CONNECTION



DUCTILE IRON GRATE



INSTALLATION

DRAIN BASIN NOTES:

GENERAL

PVC surface drainage inlets shall be include the inline drains and drain basin as indicated on the control drawings. The cast iron grates for each of these fittings are to be considered an integral part of the surface drainage inlet and shall be furnished by the same manufacturer. The surface drainage inlets shall be as manufactured by Nyloplast, or prior approved equal.

MATERIALS

The inline drains and drain basins required for this contract shall be manufactured from PVC pipe stock. The drainage pipe connection stubs shall be manufactured from PVC pipe stock and formed to provide a watertight connection with the piping system specified. This joint tightness shall conform to ASTM D3212.

Surface drainage products shall meet the mechanical property requirements for fabricated fittings as described in ASTM [illegible], [illegible], and [illegible].

The grates furnished for all surface drainage inlets shall be cast or ductile iron and shall be made specifically for each fitting. Grates for 12" and larger drain basins and inline drain basins shall be capable of supporting H-10 wheel loading for pedestrian grates and solid covers. Grates for drain basins and inline drains inlets smaller than 12" shall be capable of supporting light wheel load traffic. Metal used in the manufacture of the castings shall conform to ASTM A-48-83 Class 30B for cast iron or A536 grade 70-50-05 for ductile iron. The castings shall be furnished with a black paint.

INSTALLATION

The specified PVC surface drainage inlets shall be installed using conventional flexible pipe backfill materials and procedures. For traffic rated installations H-20 or H-10, the inline drain or drain basin shall be installed conforming to the manufacturer's installation guidelines for traffic rated (H-20 or H-10) installations. The backfill material shall be crushed stone or other granular material meeting the requirements of class 1 or 2 material as defined in ASTM D2321. The surface drainage inlets shall be bedded and backfilled uniformly in accordance with ASTM D2321.
